

AUTOMATIC MASALA PACKING PLANT (AMC-30 model)

Premium Spice Quality

Consistent flavor, aroma & color

Food Safety Compliance

Hygienic food-grade processing.

Advanced Automation

Accurate filling & packaging

High-Speed Packaging

Reliable and efficient operation

Complete Turnkey Solutions for **Spice
Processing & Packaging**

COMPANY OVERVIEW

Salvin Industries is a trusted engineering and turnkey solution provider specializing in AMC-30 Automatic Masala Packing Plants. We offer complete solutions for spice processing, packaging automation, machinery installation, and production optimization. Our solutions are designed to help manufacturers achieve efficient, hygienic, and high-quality spice packaging operations.

Our advanced packaging systems are designed to ensure product accuracy, hygiene, and consistent quality while maximizing operational efficiency. We help manufacturers achieve reliable and cost-effective spice packaging operations. We focus on delivering reliable systems that enhance productivity while maintaining superior packaging standards.

With a strong focus on innovation, quality, and customer satisfaction, we deliver customized solutions tailored to specific production requirements. Our expertise enables businesses to establish modern, scalable, and high-performance packaging facilities.

GARLIC PASTE

PROCESS FLOW

GARLIC PASTE PROCESS FLOW

Key Features

- Fully Automated Operation
- Superior Product Consistency
- Energy-Efficient Performance
- Quality Assurance & Food Safety

THE PROCESS

01 Raw Spice Receiving

The process begins with receiving high-quality raw spices from approved suppliers. Each batch is inspected for purity, aroma, color, and moisture content. Only quality-approved spices are accepted for processing. Proper raw material selection plays a vital role in ensuring superior product quality and consistency.

02 Cleaning & Sorting

Raw spices are cleaned to remove dust, stones, stalks, and other foreign materials. Advanced sorting systems ensure only pure and high-quality spices proceed further. This improves product safety and consistency. Efficient cleaning also helps enhance the overall quality of the final product.

03 Grinding / Pulverizing

Cleaned spices are processed through grinding equipment to achieve the desired powder fineness. Advanced pulverizers help preserve the natural flavor and aroma of spices. Uniform grinding ensures consistent product quality. Controlled processing minimizes product loss and improves production efficiency.

THE PROCESS

04 Sieving

Ground spices pass through a vibro sifter to obtain a uniform particle size. Oversized particles and impurities are removed during this stage. Sieving improves product appearance and consistency. This process ensures that the final product meets quality standards and customer expectations.

05 Blending & Mixing

Different spices and ingredients are blended according to the required formulation. Advanced mixers ensure uniform distribution of all components. This process guarantees consistent flavor, color, and aroma. Accurate blending helps maintain product quality across every production batch.

06 Quality Inspection

The blended product undergoes quality checks for moisture, texture, particle size, and purity. Strict inspection ensures compliance with food safety standards. Only approved batches proceed to packaging. Continuous monitoring helps maintain product reliability and customer satisfaction.

THE PROCESS

07 Automatic Filling & Packaging

Finished spice powder is automatically filled into pouches, jars, or containers. Advanced packaging systems ensure accurate filling and hygienic handling. Proper packaging helps preserve freshness and shelf life. Attractive packaging also enhances product presentation and market appeal.

08 Filling & Packaging

Packaged products are packed into cartons and arranged on pallets for easy storage and transportation. Automated systems improve efficiency and reduce manual handling. Proper packing ensures product protection. Organized palletizing simplifies warehouse management and logistics operations.

09 Finished Product Dispatch

Finished products are stored in controlled warehouse conditions before dispatch. Efficient logistics and inventory management ensure timely delivery. Products are shipped while maintaining quality and packaging integrity. Proper distribution practices ensure safe transportation and customer satisfaction.
